

EasySave v1.1

Release Note

Version	v1.1
Release date	06/05/2026
Type	Log Format Selection (Deliverable 2)
Framework	.NET 10.0, Windows 10+
Contributors	Manil Doudou, Youcef Djarir, Isaac Sastre

What's New

Log Format Selection

- Flexible daily log format — the daily log can now be written in **XML** as an alternative to the default JSON. A new `LogFormat` setting in `%APPDATA%\EasySave\config.json` lets you choose "Json" or "Xml".
- All v1.0 features are fully retained: interactive console menu in English, French and Spanish; up to 5 configurable backup jobs (Full/Differential); non-interactive CLI mode (`EasySave.exe 1-3`, `EasySave.exe 1;3`); real-time state file (`state.json`).
- Daily log file naming adapts to the chosen format: `YYYY-MM-DD.json` or `YYYY-MM-DD.xml`.
- Command-line behaviour is unchanged from v1.0.

EasyLog.dll

The logging library has been extended to support both formats while maintaining full backward compatibility.

- **DailyLogger** now accepts a `LogFormat` parameter (`Json` or `Xml`) and writes the daily log accordingly. Existing JSON integrations continue to work without modification.
- **StateLogger** remains JSON-only — no changes.
- All future EasyLog updates will remain backward-compatible with v1.0 and v1.1.

Known Limitations

- Maximum of 5 backup jobs — will be removed in v2.0.
- Jobs run sequentially — parallel execution planned for v3.0.
- No graphical interface in this version — WPF/MVVM GUI planned for v2.0.
- Log format is a global setting; all jobs share the same format.
- No file encryption — planned for v2.0.
- No business software detection — planned for v2.0.

Upgrade Path

- **Version 2.0:** graphical interface (WPF/MVVM), unlimited jobs, CryptoSoft encryption, business software detection.

The EasyLog library and config format will remain unchanged so existing v1.0 and v1.1 installations can be upgraded in place without data loss.
