### What's New

#### Graphical User Interface (WPF / MVVM)

- A full WPF desktop application replaces the console menu for day-to-day use.
- Dark theme with ProSoft branding (black background, purple accents).
- Add, edit, delete, and run backup jobs directly from the interface.
- Unlimited backup jobs — the 5-job cap from v1.0/v1.1 has been removed.
- Settings window for log format, language, CryptoSoft path, business software, and encrypted extensions.
- Real-time status messages displayed in the main window.

#### CryptoSoft — File Encryption

- Files can now be encrypted after backup using the external CryptoSoft.exe tool.
- XOR encryption with a 4-byte key. Encryption is applied in-place on the target file.
- Encrypted extensions are configurable per installation (e.g. .txt, .docx).
- Encryption time is recorded in the daily log (EncryptionTime field in ms).
- A negative EncryptionTime value indicates an encryption error.

#### Business Software Detection

- Backup jobs are blocked if a configured business application is currently running.
- The business software list is fully configurable in the Settings window.
- Detection is checked before each job starts and between each file during execution.
- If detected mid-job, the backup stops and logs the interruption.
- Status message updates to show the job was stopped.

#### EasyLog.dll Updates

- EncryptionTime field added to LogEntry (0 = no encryption, >0 = ms elapsed, <0 = error).
- XML log format support carried over from v1.1.
- StateLogger unchanged — JSON only.

### Known Limitations

- Language switching in the GUI is not yet implemented — labels are hardcoded in English. Planned for v3.0.

- Jobs run sequentially — parallel execution planned for v3.0.
- CryptoSoft.exe may be flagged by antivirus software due to XOR encryption behaviour.

## **Upgrade Path**

Version 3.0: GUI language switching, parallel job execution, and additional planned features. The EasyLog library and config format remain backward-compatible with v1.0 and v1.1.
