

EasySave v1.0

Release Note

Version	v1.0
Release date	22/04/2026
Type	Initial release (Deliverable 1)
Framework	.NET 10.0, Windows 10+
Contributors	Manil Doudou, Youcef Djarir, Isaac Sastre

What's New

Console Application

- Interactive menu available in English, French and Spanish.
- Up to five backup jobs, each with an independent name, source, target and type.
- Non-interactive CLI mode: EasySave.exe 1-3 or EasySave.exe 1;3 runs jobs without opening the menu.
- Source and target directories can point to local disks, external drives or network shares.

Backup Types

- Full backup: copies the entire source tree on every run.
- Differential backup: transfers only files that are new or more recent than their target counterpart.

Daily Log File

- All file transfers are written to a daily log file in real time (YYYY-MM-DD.json).
- Location: %APPDATA%\EasySave\Logs\
- Each entry contains: job name, source path, target path, file size, transfer time in ms.
- Negative transfer time indicates a copy error.

Real-Time State File

- A single state.json file reflects the live progress of every job.
- Location: %APPDATA%\EasySave\State\state.json
- Updated after every individual file copy — can be polled by monitoring tools.

Configuration

- Job configuration is stored in %APPDATA%\EasySave\config.json and survives application restarts.
- No hardcoded paths — fully compatible with customer server environments.

EasyLog.dll

The logging layer has been extracted into a standalone class library so other ProSoft products can reuse it without taking a dependency on EasySave itself. The library exposes two classes:

- DailyLogger — appends one LogEntry record to the current day's JSON file.
- StateLogger — keeps an in-memory snapshot of all job states and rewrites state.json after each file transfer.

Future updates to EasyLog will remain backward-compatible with version 1.0 of EasySave.

Known Limitations

- Maximum of 5 backup jobs — will be removed in v2.0.
- Jobs run sequentially — parallel execution planned for v2.0.
- No graphical interface in this version — GUI built on MVVM architecture planned for v2.0.
- Log files in JSON format only — XML support planned for v1.1.
- No file encryption — planned for v2.0.
- No business software detection — planned for v2.0.

Upgrade Path

- Version 1.1: choice between JSON and XML log file format.
- Version 2.0: graphical interface (MVVM), unlimited jobs, CryptoSoft encryption, business software detection.

The EasyLog library and config format will remain unchanged so existing installations can be upgraded in place.
