

EasySave v3.0

Release Note

Version	v3.0
Release date	12/05/2026
Type	Parallel Backup + Language Switching + Docker Logs + Priority/Large File Settings
Framework	.NET 8.0, Windows 10+
Contributors	Manil Doudou, Youcef Djarir, Isaac Sastre

What's New

Parallel Backup

- Backup jobs now run in parallel using threads, replacing the sequential mode of v2.0.
- Multiple jobs execute simultaneously for faster overall backup completion.
- Real-time progress percentage is displayed per job in the GUI.
- Each job can be individually paused (after current file), resumed, or stopped immediately.
- A global pause/resume/stop applies to all running jobs at once.

Priority File Management

- Users can define a list of priority file extensions in Settings.
- No non-priority file is transferred while priority-extension files are pending in any job.
- Priority extensions are configurable per installation.

Large File Bandwidth Limit

- A configurable size threshold (n KB) prevents two large files from transferring simultaneously.
- While one large file is transferring, other jobs may still transfer smaller files.
- The threshold is set in Settings (default: 1024 KB).

Business Software Detection — Pause & Auto-Resume

- Changed from v2.0: detection no longer stops the job permanently.
- When business software is detected, all active backups are paused automatically.
- Backups resume automatically as soon as the business software is closed.

CryptoSoft — Single Instance

- CryptoSoft now uses a mutex to prevent multiple simultaneous instances.
- If a second instance attempts to launch, it waits until the first completes.

Docker Log Centralization

- A Docker-based log server receives log entries in real time via HTTP POST.
- Three modes: Local only, Remote only (Docker), or Both.

- The Docker server URL is configurable in Settings.
- A single daily JSON file is maintained on the server regardless of number of clients.
- The docker-server folder contains server.py, Dockerfile, and docker-compose.yml.

Language Switching — GUI

- All GUI labels now update immediately when the language is changed in Settings.
- English, French, and Spanish are fully supported in the GUI.
- Language keys are stored in LanguageManager and applied via code-behind on settings save.

Known Limitations

- JobEditWindow and SettingsWindow labels are not yet translated (main window only).
- CryptoSoft.exe may still be flagged by antivirus software due to XOR encryption behaviour.
- Docker server requires Docker Desktop to be running before launching EasySave.

Upgrade Path

EasyLog, config.json, and settings.json remain backward-compatible with v1.0, v1.1, and v2.0. New settings fields (DockerLogMode, DockerLogUrl, PriorityExtensions, MaxLargeFileKb) default to safe values if absent from existing settings.json files.
